

Manual Testing task

- What approach have you used to test the website?

For this assessment, my approach was to cover most of the cases while testing with an intent to find bugs on the website.

- What tests you tried out to verify that the website is working as intended, based on your measurement.

I performed functional testing, usability testing, cross browser testing and compatibility testing to make sure the website is working as intended.

- Short documentation of those tests (e.g different settings, input values etc)

Functional Testing:

- Verifying that there are no broken links on the website
- Verifying the timer using valid and invalid input values in the input field
- Verifying the timer countdown
- Verifying the timer with predefined timers
- Verifying the timer by passing different parameters through url
- Verifying different settings of the timer to make sure it's working as expected for example changing themes, enable/disable notifications, adjust alert volume.
- Verifying the alert pop when the time expires
- Verifying end to end flow of the timer

Usability Testing:

- Verifying the navigation of the website
- Verifying the content, buttons, input fields and links
- Verifying the content for spelling or grammatical errors and image icon

Compatibility testing:

- Verifying that the egg timer works as expected on mobile

Cross Browser Testing:

- Verifying all tests mentioned in the test plan on different browsers such as Safari and Firefox

There is no back button on the mobile to stop time on mobile {Not sure if it is a bug or feature}
